Name: Siddhesh Vengurlekar

Roll no: 06

## **Business Intelligence and Big Data**Analytics

## **Mini Project**

**<u>Aim:</u>** Executing CRUD operations in MongoDB shell.

## **Steps:**

1. Start The MongoDB shell.

**2.** Check for any existing databases.

```
> show dbs
admin 0.000GB
config 0.000GB
local 0.000GB
```

3. So, we do not have our own existing database, hence we'll create a new one.

```
> use emp
switched to db emp
> show dbs
admin 0.000GB
config 0.000GB
local 0.000GB
```

4. We've created a database named emp here, but it is not displayed because it's empty, so

we need to create a collection first inside this database. To insert a document into the collection json format is followed.

**5.** Here, we've created a collection in the emp database named employee and added a document of one employee. So now if we check the databases on the system we can see the school database.

**6.** Now, to check if the document is added in the collection we run:

```
> show collections
employee
> db.employee.find()
{ "_id" : ObjectId("62491fa278e71e74d96b04fa"), "Name" : "Yash", "Rollno" : 16 }
>
```

7. So, the document we inserted earlier is shown here. If we want it in a more readable format we can use the pretty() function.

**8.** We know how to create a database. Now let's see how to delete/drop a database. Here, I've already created another sample database "demodb" with a document in it.

```
> use demodb
switched to db demodb
> db.test.insertOne({Name:"xyz"})
{
         "acknowledged" : true,
         "insertedId" : ObjectId("6249249e8adcdd5034668686")
}
>
```

```
show dbs
admin
         0.000GB
company
         0.000GB
config
         0.000GB
demodb
         0.000GB
emp
         0.000GB
local
         0.000GB
 use demodb
switched to db demodb
 db.dropDatabase()
  "ok" : 1 }
 show dbs
admin
         0.000GB
company 0.000GB
config
         0.000GB
        0.000GB
local
         0.000GB
```

**9.** To drop a single collection, you can do as follows:

```
> db.test.drop()
true
> _
```

- 10. The basic CRUD operations include Create, Read, Update & Delete.
- **11.** The Create commands are of two types "insertOne(data, options)" & "insertMany([data], options)".
- 12. The Read commands are of two types "find(filter, options)" & "findOne(filter, options)".
  - **13.** The Update command are of three types "updateOne(filter, data, options)"; "updateMany(filter, data, options)" & "replaceOne(filter, data, options)".
  - **14.** The Delete command are of two types "deleteOne(filter, options)" & "deleteMany(filter, options)".
  - **15.** Executing the insertOne and insertMany commands:

```
> use school
switched to db school
> db.employee.insertOne({name:"Omkar", empid:01})
{
         "acknowledged" : true,
         "insertedId" : ObjectId("624927db5e5098e43fc337bb")
}
```

**16.** Let us now check the database.

```
> show dbs
admin 0.000GB
config 0.000GB
emp 0.000GB
local 0.000GB
school 0.000GB
> use school
switched to db school
> show collections
employee
> _
```

17. Here check the records/document we have updated in the collection employee

**18.** Here, we've successfully executed the insertOne and insertMany commands and also Read the data in the Document.

19. Now let's try updating the empid of Aditya to 4 in the document.

```
> db.employee.updateOne({name:"Aditya"},{$set:{empid:4}})
{ "acknowledged" : true, "matchedCount" : 1, "modifiedCount" : 1 }
> _
```

**20.**Check if the value is updated:

```
> db.employee.find().pretty()
{
        "_id" : ObjectId("624927db5e5098e43fc337bb"),
        "name" : "Omkar",
        "empid" : 1
}
{
        "_id" : ObjectId("624928b25e5098e43fc337bc"),
        "name" : "Yash",
        "empid" : 2
}
{
        "_id" : ObjectId("624928b25e5098e43fc337bd"),
        "name" : "Aditya",
        "empid" : 4
}
```

21. Now lets try updateMany command

```
> db.employee.updateMany({}, {$set: {relationshipStatus: "unknown"}})
{ "acknowledged" : true, "matchedCount" : 3, "modifiedCount" : 3 }
> _
```

22. Keeping the first parameter blank means updating all the entries.

```
> db.employee.find().pretty()
{
    "_id" : ObjectId("624927db5e5098e43fc337bb"),
    "name" : "Omkar",
    "empid" : 1,
    "relationshipStatus" : "unknown"
}
{
    "_id" : ObjectId("624928b25e5098e43fc337bc"),
    "name" : "Yash",
    "empid" : 2,
    "relationshipStatus" : "unknown"
}
{
    "_id" : ObjectId("624928b25e5098e43fc337bd"),
    "name" : "Aditya",
    "empid" : 4,
    "relationshipStatus" : "unknown"
}
}
```

**23.** Now let's change the status of one employee.

```
> db.employee.updateOne({name:"Yash"}, {$set: {"relationshipStatus" : "Married"}})
{ "acknowledged" : true, "matchedCount" : 1, "modifiedCount" : 1 }
>
```

```
> db.employee.find().pretty()
{
        "_id" : ObjectId("624927db5e5098e43fc337bb"),
        "name" : "Omkar",
        "empid" : 1,
        "relationshipStatus" : "unknown"
}
{
        "_id" : ObjectId("624928b25e5098e43fc337bc"),
        "name" : "Yash",
        "empid" : 2,
        "relationshipStatus" : "Married"
}
{
        "_id" : ObjectId("624928b25e5098e43fc337bd"),
        "name" : "Aditya",
        "empid" : 4,
        "relationshipStatus" : "unknown"
}
```

**24.** Now using the Find command to find an entry with a particular tag.

```
> db.employee.find({empid: 4}).pretty()
{
        "_id" : ObjectId("624928b25e5098e43fc337bd"),
        "name" : "Aditya",
        "empid" : 4,
        "relationshipStatus" : "unknown"
}
>
```

- **25.**Now we can work on some delete operations.
- **26.**So now let's delete an entry from an employee using deleteOne() where relationshipStatus is Married.

```
> db.employee.deleteOne({name:"Yash"})
{ "acknowledged" : true, "deletedCount" : 1 }
> _
```

```
> db.employee.find().pretty()
{
        "_id" : ObjectId("624927db5e5098e43fc337bb"),
        "name" : "Omkar",
        "empid" : 1,
        "relationshipStatus" : "unknown"
}
{
        "_id" : ObjectId("624928b25e5098e43fc337bd"),
        "name" : "Aditya",
        "empid" : 4,
        "relationshipStatus" : "unknown"
}
```

27. Now deleting users with deleteMany() operations where relationshipStatus is unknown.

```
> db.employee.deleteMany({relationshipStatus: "unknown"})
{ "acknowledged" : true, "deletedCount" : 2 }
> db.employee.find().pretty()
>
```

- **28.** All records are deleted and hence we now have an empty collection.
- **29.** This is all with the CRUD operations in MongoDB.
